Our idea for the final project is to analyse the transportation that people in Jakarta use to travel around the city. As we know, Jakarta is one of the most congested city in the world especially when it's raining. However, for this idea we still haven't found the best dataset and we are still finding for the dataset. Also, if at some point we can't find the perfect dataset for this idea, we might change and find another topic.

For now, we have found the dataset of public transportation that people use around the world from Moovit.
